DETAILED ACTION

Information Disclosure Statement

1. The information disclosure statement filed 7-17-2006 (certified mailing date of 7-14-2006) fails to comply with 37 CFR 1.98(a)(2), which requires a legible copy of each cited foreign patent document; each non-patent literature publication or that portion which caused it to be listed; and all other information or that portion which caused it to be listed. It has been placed in the application file, but the information referred to therein under "OTHER DOCUMENTS" has not been considered.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1,12, 16 and 20 are rejected under 35 U.S.C. 102(b) as being anticipated by Maley et al (US 5,915,107).

Maley et al discloses a system and method for aligning data transferred across circuit boundaries having different clock domains, wherein a first clock signal (PCLK) operates in a first clock domain and a second clock signal (BCLK) operates in a second clock domain, said first and second clock signals of the same frequency but operating out of phase comprising:

a buffer circuit (135) comprising latch means receiving data clocked in said first clock domain and latching said received data in said second clock domain by one of a first edge of

Art Unit: 2611

said second clock signal, or a second opposite edge of said second clock signal (see col.5:63-67); and

a control circuit means for receiving said first and second clock signals and determining a phase relationship there between, said control circuit generating a control signal based on said determined phase relationship (see col. 11, lines 56-60), said control signal implemented for selecting one of said first edge of said second clock signal, or said second opposite edge of said second clock signal, for said latch means latching action in said second clock domain, wherein reliable data transfer operation is provided for all possible phase relationships of said first and second clock signals.

Allowable Subject Matter

4. Claims 2-11,13-15,17-19 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

US patent No. 6,034,541 describes latching at a rising edge of a falling edge.
